

29th September 1998

Thermosash Commercial Limited

TO WHOM IT MAY CONCERN

Carson Group were appointed Project Managers for the \$71 million Terminal Expansion Project at Christchurch International Airport Limited. This project was officially opened in September 1998.

The new Christchurch Airport International Terminal Building project incorporated some significant window system challenges. Including a 7m high, 180m long raking wall on airside and three storey open atrium with glazed sky lights.

Cladding and window systems were critical to the main building contract design performance. While the supply and installation contract for the systems was to be under the control of the main building contractor, we were involved in the technical and commercial evaluation of this package of work.

Thermosash were selected for the project because of their proven capability in this scale of project, their technical expertise and the attitude of their team. Their window system was technically the best available for this particular project. While their price was not the cheapest, the quality of their product and service were critical issues particularly considering long term maintenance issues.

We have been very impressed with Thermosash's performance, the quality of their workmanship and their ability to work in well with designers and other contractors alike. We will be pleased to use Thermosash on future projects.

Yours faithfully
Carson Group South Island Ltd
